A NOTE ON THE BILINEAR FRACTIONAL INTEGRAL OPERATOR ACTING ON MORREY SPACES

NAOYA HATANO¹ AND YOSHIHIRO SAWANO²

Abstract. The boundedness of the bilinear fractional integral operator is investigated. This bilinear fractional integral operator goes back to Kenig and Stein. The paper is oriented to the boundedness of the operator on products of Morrey spaces. This paper uses some averaging techniques to control the Morrey norm. Compared to the earlier work by He and Yan, one feels that the technique can be applied to other function spaces. Among others, the averaging operator will reduce the matters to the existing results.

1. Introduction

Recently, He and Yan investigated fractional integral operators of Grafakos type acting on Morrey spaces [8]. In this paper, by using some known results, we propose to simplify their proofs. Let $0 < q < p < \infty$. Define the Morrey norm $\| \cdot \|_{\mathcal{M}_p^q}$ by

$$\| f \|_{\mathcal{M}_p^q} = \sup \left\{ |Q|^{\frac{1}{p} - \frac{1}{q}} \| f \|_{L^q(Q)} : Q \text{ is a dyadic cube in } \mathbb{R}^n \right\}$$

for a measurable function $f$.

The Morrey space $\mathcal{M}_p^q(\mathbb{R}^n)$ is the set of all the measurable functions $f$ for which $\| f \|_{\mathcal{M}_p^q}$ is finite. We recall the definition of the dyadic cubes precisely in Section 2. A simple geometric observation shows that $\| f \|_{\mathcal{M}_p^q} \sim \sup \left\{ |Q|^{\frac{1}{p} - \frac{1}{q}} \| f \|_{L^q(Q)} : Q \text{ is a cube in } \mathbb{R}^n \right\}$ for any measurable function $f$. Here let us content ourselves with the intuitive understanding that $p$ serves as the global integrability, as is hinted by the dilation mapping $f \mapsto f(t \cdot)$, and that $q$ serves as the local integrability. We handle the following bilinear operator defined in [5,13].

Definition 1.1. The bilinear fractional integral operator of Grafakos type $J_\alpha$, $0 < \alpha < n$ is given by

$$J_\alpha[f_1, f_2](x) \equiv \int_{\mathbb{R}^n} \frac{f_1(x+y) f_2(x-y)}{|y|^{n-\alpha}} \, dy \quad (x \in \mathbb{R}^n),$$

where $f_1, f_2$ are non-negative integrable functions defined in $\mathbb{R}^n$.

The operator $I_\alpha[f_1, f_2]$, $0 < \alpha < 2n$, defined by

$$I_\alpha[f_1, f_2](x) \equiv \int_{\mathbb{R}^n \times \mathbb{R}^n} \frac{f_1(y_1) f_2(y_2)}{(|x-y_1| + |x-y_2|)^{2n-\alpha}} \, dy \quad (x \in \mathbb{R}^n)$$

for non-negative integrable functions $f_1$ and $f_2$ defined in $\mathbb{R}^n$, is a contrast to $J_\alpha[f_1, f_2]$. These two operators with $0 < \alpha < n$ pass the fractional integral operator $I_\alpha$ in the bilinear case, where $I_\alpha$ is the fractional integral operator

$$I_\alpha f(x) \equiv \int_{\mathbb{R}^n} \frac{f(y)}{|x-y|^{n-\alpha}} \, dy \quad (x \in \mathbb{R}^n)$$

for a nonnegative measurable function $f : \mathbb{R}^n \to [0, \infty]$.

Key words and phrases. Morrey spaces; Bilinear fractional integral operators.
Here and below we assume that the functions are non-negative to ignore the issue of the convergence of the integral defining $J_\alpha[f_1, f_2](x)$.

The operator $T_\alpha[f_1, f_2]$ acting on Morrey spaces is investigated by many authors in many settings such as the generalized Morrey spaces [1], the weighted setting [6, 10], the case equipped with the rough kernel [9, 20] and the non-doubling setting [11, 21]. See also [3, 22] for the case of commutators generated by $T_\alpha$ and other functions. However we do not find so much about the action of the operator $J_\alpha$ on Morrey spaces. Works [4, 8] considered the boundedness property of $J_\alpha$. Our aim here is to prove the following estimate.

**Theorem 1.2.** Let \( 0 < \alpha < n \), \( 1 < q_1 \leq p_1 < \infty \), \( 1 < q_2 \leq p_2 < \infty \), \( 1 \leq t \leq s < \infty \).

Define \( p \) and \( q \) by
\[
\frac{1}{p} = \frac{1}{p_1} + \frac{1}{p_2}, \quad \frac{1}{q} = \frac{1}{q_1} + \frac{1}{q_2}.
\]
Assume that
\[
\frac{1}{s} = \frac{1}{p} - \frac{\alpha}{n}, \quad \frac{q}{p} = \frac{t}{s}, \quad s < \min(q_1, q_2).
\]
Then for all \( f_1 \in M^p_{q_1}(\mathbb{R}^n) \) and \( f_2 \in M^p_{q_2}(\mathbb{R}^n) \),
\[
\|J_\alpha[f_1, f_2]\|_{M^s_t} \lesssim \|f_1\|_{M^{p_1}_{q_1}} \|f_2\|_{M^{p_2}_{q_2}}.
\]

As is pointed out in [8], the assumption \( \frac{2}{p} = \frac{1}{s} \) is essential. Theorem 1.2 partially extends the following result by Kenig and Stein [13, Theorem 2]

**Proposition 1.3.** Let \( 0 < \alpha < n \) and \( 1 < p_1, p_2 < \infty \). Assume that \( \frac{1}{p_1} + \frac{1}{p_2} > \frac{\alpha}{n} \), so we can define \( s > 0 \) by \( \frac{1}{s} = \frac{1}{p_1} + \frac{1}{p_2} - \frac{\alpha}{n} \). Then for all \( f_1 \in L^{p_1}(\mathbb{R}^n) \) and \( f_2 \in L^{p_2}(\mathbb{R}^n) \),
\[
\|J_\alpha[f_1, f_2]\|_{L^s_t} \lesssim \|f_1\|_{L^{p_1}_{q_1}} \|f_2\|_{L^{p_2}_{q_2}}.
\]

In the first half of [8], He and Yan proved the boundedness of the operator and used the Hölder inequality under the assumption
\[
\frac{q_1}{p_1} = \frac{q_2}{p_2}, \quad \frac{1}{\max(q_1', q_2') - \alpha \max(p_1, p_2)} > 1,
\]
so
\[
\frac{q}{p} = \frac{q_1}{p_1} = \frac{q_2}{p_2}
\]
and there exists \( u \in (1, \infty) \) such that
\[
\frac{\alpha}{n} p_1 < u < \left( \frac{\alpha}{n} p_2 \right)', \quad \left( q_2 \right)' < u < q_1.
\]
Define \( s_1, s_2, t_1 \) and \( t_2 \) by
\[
\frac{u}{s_1} = \frac{u}{p_1} - \frac{\alpha}{n}, \quad \frac{u'}{s_2} = \frac{u'}{p_2} - \frac{\alpha}{n}, \quad \frac{t_1}{s_1} = \frac{q_1}{p_1}, \quad \frac{t_2}{s_2} = \frac{q_2}{p_2},
\]
so \( 1 < t_1 \leq s_1 < \infty \) and \( 1 < t_2 \leq s_2 < \infty \). Then
\[
\frac{1}{s} = \frac{1}{s_1} + \frac{1}{s_2}, \quad \frac{1}{t} = \frac{1}{t_1} + \frac{1}{t_2},
\]
since
\[
\frac{q}{p} = \frac{q_1}{p_1} = \frac{q_2}{p_2}.
\]
Meanwhile, by the Hölder inequality we have
\[
J_\alpha[f_1, f_2](x) \leq \left( \int_{\mathbb{R}^n} \frac{|f_1(x + y)|^u}{|y|^{n-\alpha}} dy \right)^{\frac{1}{u}} \left( \int_{\mathbb{R}^n} \frac{|f_2(x - y)|^{u'}}{|y|^{n-\alpha}} dy \right)^{\frac{1}{u'}}
\]
for any $1 < u < \infty$. Consequently, by the Hölder inequality once again, we obtain

$$
\|\mathcal{J}_\alpha[f_1, f_2]\|_{\mathcal{M}_t^p} \leq \|I^{(u)}_\alpha f_1\|_{\mathcal{M}_{t_1}^p} \|I^{(u')}\alpha f_2\|_{\mathcal{M}_{t_2}^p},
$$

where $I^{(v)}_\alpha f \equiv (I_\alpha[f^v])^{\frac{1}{v}}$. If we use the Adams theorem, asserting that $I^{(v)}_\alpha$ maps $\mathcal{M}_Q^p(\mathbb{R}^n)$ boundedly to $\mathcal{M}_Q^p(\mathbb{R}^n)$ whenever $v < Q \leq P < \infty$, $v < T \leq S < \infty$, $\frac{v}{S} = \frac{v}{T} - \frac{v}{2}$, and $\frac{p}{Q} = \frac{p}{T}$, we obtain

$$
\|\mathcal{J}_\alpha[f_1, f_2]\|_{\mathcal{M}_t^p} \lesssim \|f_1\|_{\mathcal{M}_{t_1}^p} \|f_2\|_{\mathcal{M}_{t_2}^p}.
$$

Thus Theorem 1.2 is significant when (1.1) fails. See [4, Theorem 2.2] for the bilinear fractional integral operator of Kenig–Stein type equipped with the rough kernel.

The operator $\mathcal{J}_\alpha$ has a lot to do with the bilinear Hilbert transform defined by

$$
\mathcal{H}[f_1, f_2](x) = \lim_{\varepsilon \downarrow 0} \int_{\mathbb{R} \setminus (-\varepsilon, \varepsilon)} \frac{f_1(x + y) f_2(x - y)}{y} \, dy \quad (x \in \mathbb{R}),
$$

where $f_1$ and $f_2$ are the locally integrable functions. One of the important problems in harmonic analysis is to investigate the boundedness property of the bilinear Hilbert transform. A conjecture of Calderón in 1964 concerned possible extensions of $\mathcal{H}$ to a bounded bilinear operator on products of Lebesgue spaces. A remarkable fact is that $\mathcal{H}$ maps $L^{p_1}(\mathbb{R}) \times L^{p_2}(\mathbb{R})$ to $L^p(\mathbb{R})$ boundedly if $1 < p_1 \leq \infty$, $1 < p_2 \leq \infty$, $\frac{2}{3} < p < \infty$ and $\frac{1}{p} = \frac{1}{p_1} + \frac{1}{p_2}$ [16, 17]. To understand the boundedness property of this operator, we consider its counterpart to fractional integral operators.

After the authors wrote this article, we were aware that Theorem 1.2 is an unweighted version of [8, Theorem 4.6]. However, our proof differs from theirs in that we use an inequality for norms, while He and Yan used a weighted local estimate. It seems that our results can be extended to Orlicz spaces by using [19, Theorem 7.5]. The details are left for the future works.

### 2. Preliminaries

For a measurable function $f$ defined on $\mathbb{R}^n$, define a function $Mf$ by

$$
Mf(x) \equiv \sup_{B \in \mathcal{B}} \frac{\chi_B(x)}{|B|} \int_B |f(y)| \, dy \quad (x \in \mathbb{R}^n). \tag{2.1}
$$

The mapping $M : f \mapsto Mf$ is called the **Hardy–Littlewood maximal operator**. It is known that the Hardy–Littlewood maximal operator is bounded on $\mathcal{M}_q^p(\mathbb{R}^n)$ if $1 < q \leq p < \infty$ [2]. A dyadic cube is a set of the form $Q_{jk}$ for some $j \in \mathbb{Z}, k = (k_1, k_2, \ldots, k_n) \in \mathbb{Z}^n$. The set of all dyadic cubes is denoted by $\mathcal{D}; \mathcal{D} = \{Q_{jk} : j \in \mathbb{Z}, k \in \mathbb{Z}^n\}$. For $j \in \mathbb{Z}$, the set of dyadic cubes of the $j$-th generation is given by

$$
\mathcal{D}_j = \mathcal{D}_j(\mathbb{R}^n) = \{Q_{jk} : k \in \mathbb{Z}^n\} = \{Q \in \mathcal{D} : \ell(Q) = 2^{-j}\}.
$$

The following lemma can be located as a standard estimate to handle this bilinear fractional integral operator.

**Lemma 2.1.** Let $f_1, f_2 \geq 0$ be measurable functions. Then we have

$$
\mathcal{J}_\alpha[f_1, f_2](x) \lesssim \sum_{l = -\infty}^\infty \sum_{Q \in \mathcal{D}_l} 2^{l(n-\alpha)} \chi_Q(x) \int_{B(2^{-l})} f_1(x + y) f_2(x - y) \, dy \quad (x \in \mathbb{R}^n).
$$
Proof. We will follow the idea used in [13, Theorem 2]. See also [18, Theorem 3.2] and [14, 15]. We decompose
\begin{align*}
J_\alpha[f_1, f_2](x) &= \int_{\mathbb{R}^n} \frac{f_1(x + y) f_2(x - y)}{|y|^{n-\alpha}} \, dy \\
&= \sum_{l=-\infty}^{\infty} \int_{B(2^{l-1}) \setminus B(2^{l-1})} \frac{f_1(x + y) f_2(x - y)}{|y|^{n-\alpha}} \, dy \\
&\sim \sum_{l=-\infty}^{\infty} 2^{l(n-\alpha)} \int_{B(2^{l-1})} f_1(x + y) f_2(x - y) \, dy \\
&\leq \sum_{l=-\infty}^{\infty} 2^{l(n-\alpha)} \int_{B(2^{l-1})} f_1(x + y) f_2(x - y) \, dy.
\end{align*}
Observe that for each \( l \in \mathbb{N} \), there uniquely exists a dyadic cube \( Q \in D_l \) such that \( x \in Q \). Thus, we obtain the desired result. \( \square \)

We now recall the averaging technique.

Lemma 2.2. Suppose that the parameters \( p, q, s, t \) satisfy
\[ 1 < q \leq p < \infty, \quad 1 < t \leq s < \infty, \quad q < t, \quad p < s, \]
or
\[ 1 = q \leq p < \infty, \quad 1 = t \leq s < \infty, \quad p < s. \]
Assume that \( \{Q_j\}_{j=1}^{\infty} \subset D(\mathbb{R}^n) \), \( \{a_j\}_{j=1}^{\infty} \subset \mathcal{M}_s^e(\mathbb{R}^n) \) and \( \{\lambda_j\}_{j=1}^{\infty} \subset [0, \infty) \) fulfill
\[ \text{supp}(a_j) \subset Q_j, \quad \left\| \sum_{j=1}^{\infty} \lambda_j \chi_{Q_j} \right\|_{\mathcal{M}_s^e} < \infty. \tag{2.2} \]

Then \( f = \sum_{j=1}^{\infty} \lambda_j a_j \) converges in \( \mathcal{S}'(\mathbb{R}^n) \cap L^q_{\text{loc}}(\mathbb{R}^n) \) and satisfies
\[ \left\| f \right\|_{\mathcal{M}_q^s} \lesssim_{p, q, s, t} \left\| \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{\mathcal{M}_s^e}}{|Q_j|^\frac{1}{t}} \chi_{Q_j} \right\|_{\mathcal{M}_q^s}. \tag{2.3} \]

Proof. This estimate is essentially obtained in [12] if \( q > 1 \) and in [7] if \( q = 1 \). Although we distinguished these cases in these papers, we can combine them, since the case of \( q = 1 \) can almost be emerged into the case of \( q > 1 \).

Let us suppose \( q > 1 \) for the time being. Let \( 0 < \eta < \infty \). We will use the powered Hardy–Littlewood maximal operator \( M^{(\eta)} \) defined by
\[ M^{(\eta)} f(x) \equiv \sup_{R > 0} \left( \frac{1}{|B(x, R)|} \int_{B(x, R)} |f(y)|^\eta \, dy \right)^{\frac{1}{\eta}} \]
for a measurable function \( f : \mathbb{R}^n \to \mathbb{C} \). If \( \eta = 1 \), then we write \( M \) instead of \( M^{(\eta)} \). To prove this, we resort to the duality. For the time being, we assume that there exists \( N \in \mathbb{N} \) such that \( \lambda_j = 0 \) whenever \( j \geq N \). Let us assume in addition that the \( a_j \)'s are non-negative. Fix a non-negative function \( g \) that is supported on a cube \( Q \) such that \( \|g\|_{L^q} \leq |Q|^{\frac{1}{q} - \frac{1}{s}} \). By duality, we will show
\[ \int_{\mathbb{R}^n} f(x) g(x) \, dx \lesssim_{p, q, s, t} \left\| \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{\mathcal{M}_s^e}}{|Q_j|^\frac{1}{t}} \chi_{Q_j} \right\|_{\mathcal{M}_q^s}. \tag{2.4} \]
to obtain
\[ \|f\|_{M^p_t} \lesssim_{p,q,s,t} \left\| \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{1}{t}}} \chi_{Q_j} \right\|_{M^p_t} . \]

Assume first that each \( Q_j \) contains \( Q \) as a proper subset. If we group the \( j \)'s such that \( Q_j \) are identical, we can assume that each \( Q_j \) is a \( j \)-th parent of \( Q \) for each \( j \in \mathbb{N} \). Then we have
\[
\int_{\mathbb{R}^n} f(x) g(x) \, dx = \sum_{j=1}^{\infty} \lambda_j \int_{Q_j} a_j(x) g(x) \, dx \leq \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{L^t(Q_j)} \|g\|_{L^{t'}(Q_j)}
\]
from \( f = \sum_{j=1}^{\infty} \lambda_j a_j \). By the size condition of \( a_j \) and \( g \), we obtain
\[
\int_{\mathbb{R}^n} f(x) g(x) \, dx \leq \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{M^p_t} |Q_j|^{\frac{1}{t'} - \frac{1}{t}} |Q_j|^{\frac{1}{t''} - \frac{1}{t'}} = \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{M^p_t} |Q_j|^{\frac{1}{t'} - \frac{1}{t'}}.
\]
Note that
\[
\left\| \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{1}{t}}} \chi_{Q_j} \right\|_{M^p_t} \geq \left\| \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{1}{t}}} \chi_{Q_j} \right\|_{M^p_t} = \|a_j\|_{M^p_t} |Q_j|^{\frac{1}{t'} - \frac{1}{t}} \lambda_j
\]
for each \( j_0 \in \mathbb{N} \). Consequently, it follows from the condition \( p < s \) that
\[
\int_{\mathbb{R}^n} f(x) g(x) \, dx \leq \sum_{j=1}^{\infty} |Q_j|^{\frac{1}{t'} - \frac{1}{t}} |Q_j|^{\frac{1}{t''} - \frac{1}{t'}} \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{M^p_t} \chi_{Q_j} \|g\|_{L^{t'}(Q_j)} \leq \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{M^p_t} \chi_{Q_j} \|g\|_{L^{t'}(Q_j)}.
\]
Conversely, assume that \( Q \) contains each \( Q_j \). Then we have
\[
\int_{\mathbb{R}^n} f(x) g(x) \, dx = \sum_{j=1}^{\infty} \lambda_j \int_{Q_j} a_j(x) g(x) \, dx \leq \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{L^t(Q_j)} \|g\|_{L^{t'}(Q_j)}.
\]
By the condition of \( a_j \), we obtain
\[
\int_{\mathbb{R}^n} f(x) g(x) \, dx = \sum_{j=1}^{\infty} \lambda_j \int_{Q_j} a_j(x) g(x) \, dx \leq \sum_{j=1}^{\infty} \lambda_j \|a_j\|_{M^p_t} \chi_{Q_j} \|g\|_{L^{t'}(Q_j)}.
\]
Thus, in terms of the Hardy–Littlewood maximal operator \( M \), we obtain
\[
\int_{\mathbb{R}^n} f(x) g(x) \, dx \leq \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{1}{t}}} \chi_{Q_j} \times \inf_{y \in Q_j} M^{(t')} g(y)
\]
\[
\leq \int_{\mathbb{R}^n} \left( \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{1}{t}}} \chi_{Q_j}(y) \right) M^{(t')} g(y) \, dy
\]
\[
\leq \int_{\mathbb{R}^n} \left( \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{1}{t}}} \chi_{Q_j}(y) \right) \chi_{Q}(y) M^{(t')} g(y) \, dy.
\]
Hence, we obtain (2.4) by the Hölder inequality, since \( \|\chi_Q M^{(t')} g\|_{L^{t'}} \lesssim |Q|^{\frac{1}{t'} - \frac{1}{s}} \). Thus the proof for the case of \( q > 1 \) is complete.

The case of \( q = 1 \) is a minor modification of the above proof. First, if each \( Q_j \) contains \( Q \) as a proper subset, the same argument as above works. If each \( Q \) contains \( Q_j \), then we can take \( g = |Q|^{\frac{1}{t'} - 1} \chi_{Q} \) to obtain
\[
\int_{Q} f(x) g(x) \, dx \lesssim_{p,s} \left\| \sum_{j=1}^{\infty} \lambda_j \frac{\|a_j\|_{M^p_t}}{|Q_j|^{\frac{s}{t}}} \chi_{Q_j} \right\|_{M^p_t}.
\]
We go through the same argument as before, where we will replace $M^{(i)}g$ by $1$. Since $\|\chi_Q 1\|_{L^\infty} = 1$, we do not have to resort to the boundedness of the maximal operator $M^{(i)}$ as we did in the estimate $\|\chi_Q M^{(i)}g\|_{L^{q'}} \lesssim |Q|^{\frac{1}{2} - \frac{1}{q}}$. So, the proof is complete in this case. 

**Lemma 2.3.** Let

$$0 < \alpha < 2n, \quad 1 < q_j \leq p_j < \infty, \quad 0 < q \leq p < \infty, \quad 0 < t \leq s < \infty$$

for $j = 1, 2$. Assume

$$\frac{1}{p} = \frac{1}{p_1} + \frac{1}{p_2}, \quad \frac{1}{q} = \frac{1}{q_1} + \frac{1}{q_2}, \quad \frac{1}{s} = \frac{1}{n} - \frac{\alpha}{n}, \quad \frac{q}{p} = \frac{t}{s}.$$ 

Then

$$|R|^\frac{s}{p} - \frac{1}{2} \left\| \sum_{Q \in D} \frac{\chi_Q}{\ell(Q)^{2n-\alpha}} \int f_1(y_1) f_2(y_2) \, dy_1 \, dy_2 \right\|_{L^s(R)} \lesssim \prod_{j=1}^2 \|f_j\|_{\mathcal{M}_{p_j}^s}$$

for any cube $R$ and for all non-negative measurable functions $f_1, f_2$.

See the proof of [4, Theorem 2.2] for a similar approach.

**Proof.** Let $L = L(x)$ be a positive number that is specified shortly. We decompose

$$\sum_{Q \in D} \frac{\chi_Q(x)}{\ell(Q)^{2n-\alpha}} \int f_1(y_1) f_2(y_2) \, dy_1 \, dy_2$$

$$= \sum_{Q \in D, \ell(Q) \leq L} \frac{\chi_Q(x)}{\ell(Q)^{2n-\alpha}} \int f_1(y_1) f_2(y_2) \, dy_1 \, dy_2$$

$$+ \sum_{Q \in D, \ell(Q) > L} \frac{\chi_Q(x)}{\ell(Q)^{2n-\alpha}} \int f_1(y_1) f_2(y_2) \, dy_1 \, dy_2 =: S_1 + S_2.$$

First, we estimate the quantity $S_1$:

$$S_1 \lesssim \sum_{Q \in D, \ell(Q) \leq L} \chi_Q(x) \ell(Q)^{\alpha} M f_1(x) M f_2(x) \sim L^\alpha M f_1(x) M f_2(x).$$

Next, we estimate the quantity $S_2$. By Hölder’s inequality,

$$S_2 \lesssim \sum_{Q \in D, \ell(Q) > L} \frac{\chi_Q(x)}{\ell(Q)^{2n-\alpha}} |Q|^{-\frac{1}{p}} \|f_1\|_{L^{p_1}(Q)} \cdot |Q|^{-\frac{1}{q}} \|f_1\|_{L^{q_1}(Q)}$$

$$\lesssim \sum_{Q \in D, \ell(Q) > L} \chi_Q(x) |Q|^{-\frac{1}{p}} \|f_1\|_{\mathcal{M}_{p_1}} \|f_2\|_{\mathcal{M}_{p_2}} \sim L^{-\frac{1}{p}} \|f_1\|_{\mathcal{M}_{p_1}} \|f_2\|_{\mathcal{M}_{p_2}}.$$

Hence we obtain

$$\sum_{Q \in D} \frac{\chi_Q(x)}{\ell(Q)^{2n-\alpha}} \int f_1(y_1) f_2(y_2) \, dy_1 \, dy_2 \lesssim L^\alpha M f_1(x) M f_2(x) + L^{-\frac{1}{p}} \|f_1\|_{\mathcal{M}_{p_1}} \|f_2\|_{\mathcal{M}_{p_2}}.$$ 

In particular, choose the constant $L = L(x)$ to optimize the right-hand side:

$$L = \left( \frac{\|f_1\|_{\mathcal{M}_{p_1}} \|f_2\|_{\mathcal{M}_{p_2}}}{M f_1(x) M f_2(x)} \right)^{\frac{1}{p}}.$$

Then we have

$$\sum_{Q \in D} \frac{\chi_Q(x)}{\ell(Q)^{2n-\alpha}} \int f_1(y_1) f_2(y_2) \, dy_1 \, dy_2 \lesssim (M f_1(x) M f_2(x))^\frac{1}{p} \left( \|f_1\|_{\mathcal{M}_{p_1}} \|f_2\|_{\mathcal{M}_{p_2}} \right)^{1-\frac{1}{p}}.$$
Therefore, using Hölder’s inequality for Morrey spaces, the \( \mathcal{M}_{p_1}^q(\mathbb{R}^n) \)-boundedness of \( M \) and the \( \mathcal{M}_{p_2}^q(\mathbb{R}^n) \)-boundedness of \( M \), we have

\[
|R|^{\frac{s}{p} + \frac{1}{q}} + \sum_{Q \in D} \frac{\chi_Q}{|Q|^{2n-\alpha}} \int_{(3Q)^2} f_1(y_1) f_2(y_2) \, dy_1 \, dy_2 \leq \left( \|Mf_1\|_{\mathcal{M}_{p_1}^q} \|Mf_2\|_{\mathcal{M}_{p_2}^q} \right)^{\frac{s}{p}} + \left( \|Mf_1\|_{\mathcal{M}_{p_1}^q} \|Mf_2\|_{\mathcal{M}_{p_2}^q} \right)^{\frac{1}{q}}
\]

3. Proof of Theorem 1.2

Let \( v \in (s, \min(q_1, q_2)) \). Let \( x \in Q \in D_1 \). By the Minkowski inequality and the Hölder inequality,

\[
\left\| \int_{B(2^{-1})} f_1(\cdot + y) f_2(\cdot - y) \, dy \right\|_{L^v(Q)} \leq \int_{B(2^{-1})} \|f_1(\cdot + y) f_2(\cdot - y)\|_{L^v(Q)} \, dy \leq |B(2^{-1})|^{\frac{1}{v}} \left( \int_{B(2^{-1})} \|f_1(\cdot + y) f_2(\cdot - y)\|_{L^v(Q)} \, dy \right)^{\frac{1}{v}}
\]

Then owing to Theorem 2.2,

\[
\|\mathcal{J}_n[f_1, f_2]\|_{\mathcal{M}^t} \lesssim \sum_{l=-\infty}^{\infty} \sum_{Q \in D_1} 2^{\ell(n-\alpha)} \frac{\chi_Q}{|Q|^{\frac{1}{2}}} \left\| \int_{B(2^{-1})} f_1(\cdot + y) f_2(\cdot - y) \, dy \right\|_{L^v(Q)} \approx \sum_{l=-\infty}^{\infty} \sum_{Q \in D_1} 2^{-10a} \frac{\chi_Q}{|Q|} \left\| M(v) f_1(y_1) \, dy_1 \right\|_{\mathcal{M}_{p_1}^q} \left\| M(v) f_2(y_2) \, dy_2 \right\|_{\mathcal{M}_{p_2}^q}.
\]

Thus, we are again in the position of using (2.5) to have

\[
\|\mathcal{J}_n[f_1, f_2]\|_{\mathcal{M}^t} \lesssim \left\| M(v) f_1 \right\|_{\mathcal{M}_{p_1}^q} \left\| M(v) f_2 \right\|_{\mathcal{M}_{p_2}^q}.
\]

Since \( v < q_1, q_2 \), we are in the position of using the boundedness of \( M \) on Morrey spaces obtained by Chiarenza and Frasca [2]. If we use the boundedness of the Hardy–Littlewood maximal operator, then we obtain

\[
\|\mathcal{J}_n[f_1, f_2]\|_{\mathcal{M}^t} \lesssim \left\| f_1 \right\|_{\mathcal{M}_{p_1}^q} \left\| f_2 \right\|_{\mathcal{M}_{p_2}^q}.
\]

This is the desired result.

To conclude the paper, we remark that Fan and Gao obtained an estimate to control

\[
\left\| \int_{B(2^{-1})} f_1(\cdot + y) f_2(\cdot - y) \, dy \right\|_{L^v(Q)}
\]

in [4, Lemma 2.1].
